

INVESTMENT OPPORTUNITY IN GOLD MINING IN CANADA

Located in Canada, 4300 acre gold property hosts a one mile long system of en-echelon intrusive-hosted shear-controlled gold-quartz veins and lenses, as well as several possible additional targets for gold, copper and molybdenum. In this Investigation 1400 OZ of gold is been taken out to date, less than 10% of the system strike length has been investigated by drilling, trenching or underground development.

The property was discovered in 1990 during a regional geochemical survey. The valley floor, and therefore most readily accessible by road, A number of occurrences found further up the mountainside have not been investigated at all. Consequently the property has considerable potential for further grassroots exploration, and requires additional drilling and underground development.
